

Khiang — Real Customer Segments: Walk-In vs Airport Staff

Built on the **post-tagging window 15–20 Jul 2026** — six days after cashiers were instructed to tag every Airport Staff customer, including ฿50-set users. 1,139 bills · ฿220,018 net sales (ex-VAT) · Reference: 4 weeks 21 Jun–18 Jul (4,903 bills). Generated 21 Jul 2026.

1. The Honest Split

Six days of enforced staff tagging (15–20 Jul) — the real shape of the business

STAFF SHARE OF BILLS

35.0%

peaked 39–42% on 17–18 Jul, faded 19–20

STAFF SHARE OF REVENUE

25.8%

฿56,746 of ฿220,018

WALK-IN SHARE OF REVENUE

74.2%

฿163,272 · 740 bills

RUN-RATE / DAY

฿36,670

vs break-even ฿37.7K today / ฿35.4K at FC28

Bills — 15–20 Jul

Revenue (ex-VAT)

► **Two different customers, one shop:** Walk-In pays ฿221/bill on average; Staff pays ฿142/bill. Walk-In is 6.5 in 10 customers and 3 in 4 baht.

2. Tagging Fix — Worked, Then Started Slipping

Daily bills by segment, 8–20 Jul · line = Staff share of bills

Daily bills by segment — spike on 17-18 Jul, fading 19-20 Jul

► Staff share stepped up to **39–42% on 17–18 Jul** (85 staff bills on the 17th — a record), proving the tagging policy works when applied. But 19–20 Jul fell back to **33% and 29%** — cashier discipline is already slipping after the first weekend.

▲ **Action needed:** re-brief cashiers — every staff ID shown = select Airport Staff customer, regardless of promo used. This number becomes the guardrail KPI for the price change; it must be reliable before Phase 1 launches. Re-base all baselines once two clean weeks exist.

3. Customer Segments — Regrouped to What Matters (15–20 Jul)

8 operating segments, numbered in order (merged from 12 raw basket groups): Walk-In W1–W5, Staff A1/B/A3. Every bill classified once. Raw-group lineage shown in grey.

Revenue by segment — final grouping (indigo = Walk-In, coral = Staff), 15–20 Jul

SEGMENT	WHO THEY ARE	BILLS	฿/ BILL	REVENUE (6D)	% OF REV	PRICE SENSITIVITY
WALK-IN — 740 bills · ฿155,155 · 74.5%						
W3 Groups & other mains (was W4+W5)	Tourist groups/families + noodle & soup mains — the revenue engine	199	334.4	66,544	32.0%	LOWEST
W1 Solo + ฿50 set	1 rice + set; standard bill ฿149.5, mean lifted by premium sets	215	197.5	42,461	20.4%	LOW (set shields)
W2 Solo no-set (was W2+W3)	1 rice (avg dish ฿117 — 26% premium solos) + à la carte extras: 26% buy a drink, 31% an egg, 16% a soup/noodle side	223	164.8	36,748	17.7%	EXPOSED (!)
W4 Other (was W6+W7)	Snacks & drink-only grab-and-go — no meal	90	71.8	6,459	3.1%	UNTOUCHED
W5 Audit / manual keys (was W8)	SE-7000001 free-form (fix at POS, not a customer)	13	226.4	2,943	1.4%	—
AIRPORT STAFF — 399 bills · ฿53,034 · 25.5% · discount usage 95%+						
A1 Staff solo (was A1+A2)	1 rice + 10% discount — the low-income signature; minimal add-ons	300	120.3	36,089	17.3%	HIGHEST → protect via 40% discount
B Staff multi-buyers	3+ items — buying for the team; biggest winner of a deeper discount	80	176.4	14,109	6.8%	MID
A3 Staff + ฿50 set (was C)	Chose set over discount — pays full price by choice, behaves like Walk-In	19	149.3	2,836	1.4%	MID

► **55.5% of revenue sits in LOW/UNTOUCHED segments (W3+W1+W4).** The genuinely vulnerable core — staff eating alone (A1) — is 26% of bills but only **17.3% of revenue**, and it can be fully protected with a deeper staff discount.

🔗 **W2 decomposed (avg bill ฿164.8 = dish 117 + soup/noodle 24.9 + drinks 11.8 + egg 5.8 + snacks 5.0 + other 1.4): this is an un-pitched segment, not a fragile one.** 26% of "no-set" solos buy a drink anyway at full price (~฿45–59 — more than the ฿50 set that includes an egg), 31% buy the egg separately, 16% add a soup or noodle side. Roughly 40% of W2 already buys set components à la carte at worse prices. When the main moves to ฿159 with the set held at ฿50, the natural migration is W2 → W1 (a converted bill ≈ ฿254 vs ฿165; a churned one = ฿0) — and the cashier script ("drink + egg for just ฿50") targets customers who have already shown they want exactly those items.

3b. Customer × Ticket Size — Who Actually Feels the Price Change

Every bill banded by its value (ex-VAT, 15–20 Jul). This lens strips out the mix-skew in segment averages (a "W1 set bill" averages ฿198 only because premium wagyu sets pull it up — the standard set bill is ฿149.5).

Price-sensitivity exposure of revenue — \$159 rice with staff discount 40%

Price change impact — affected vs not affected (staff discount 40% in place)

Bills by ticket band — fill = sensitivity (red exposed · orange protected · yellow mid · green safe)

TICKET BAND	STAFF BILLS	WALK-IN BILLS	WHO THEY ARE	SENSITIVITY
T1 ≤110	219 (55%)	174 (24%)	Staff: single discounted dish — the true low-income set. Walk-In: drinks/snacks only, no rice at all	STAFF: HIGH → protected WALK: not affected
T2 111–150	85 (21%)	205 (28%)	Standard solo meals; incl. pure ₦50-set bills (₦149.5)	STAFF: protected WALK: EXPOSED (!)
T3 151–200	55 (14%)	101 (14%)	Meal + add-ons / extra drink	MID
T4 201–300	26 (7%)	121 (16%)	Premium solos, pairs	LOW
T5 >300	14 (4%)	139 (19%)	Groups & families — ₦64,723 = 31% of all revenue alone	LOWEST

► **The truly price-sensitive customer set, quantified (15–20 Jul):**

- **EXPOSED** — Walk-In T2: **205 bills = 18.0% of bills, ₦28,661 = 13.8% of revenue**. Solo diners paying full price with no protection — the set to watch, and the set the ₦50-set anchor defends.
- **SENSITIVE BUT PROTECTED** — Staff T1+T2: **304 bills = 26.7% of bills, 15.3% of revenue**. Fully shielded by the 40% staff discount.
- **MID** — T3 both segments: **156 bills = 13.7%, 13.3% of revenue**.
- **SAFE** — **474 bills = 41.6%, 57.6% of revenue**. Groups, premium buyers, and non-rice bills.

Net read: after staff protection, only ~14% of revenue carries real churn risk — exactly the slice the set-conversion play (Section 7) targets.

4. Average Spend per Bill — the Thrift Ladder

Average ticket by operating segment (ex-VAT), 15–20 Jul

- Clean ladder: Staff solo ₦120 → Staff set ₦149 → Walk-In solo no-set ₦165 → Staff multi ₦176 → Walk-In set ₦198 → Groups & mains ₦334. The gap between the bottom rung and the top is 2.8× — price policy must treat them differently, which is exactly what the discount structure does.

5. Hourly DNA — When Each Segment Shows Up

Bills by hour of day, 15–20 Jul combined

► Staff peaks: lunch 11:00–13:00, dinner 17:00–20:00, plus the **02:00 night-shift staff pocket (65% staff)**. Walk-In owns the late evening — 21:00 is 57 Walk-In vs 8 Staff bills (late flights), the beer-□□□window. Peak load at current volume: 12:00 ≈ 18 bills/hour — comfortably within a 3-person lunch crew at today's demand.

6. What This Means for the Price Increase

QUESTION	ANSWER FROM POST-TAGGING DATA
Can we raise prices?	Yes. 54.0% of revenue is low-sensitivity or untouched by rice pricing; volume is at a 6-week high (1,314 bills last week); 63% of Walk-In bills already pay full price with no promo.
Must we raise prices?	Also yes. Today: revenue ₪36.9K/day vs break-even ₪37.7K/day (FC 31.2%) = a standing loss of ~₪18K/month. The approved ₪119 alone lifts revenue to ~₪38.4K and cuts break-even to ~₪36.8K — technically profitable, but the cushion is under 2%: one soft week and the shop is back in the red.
Who needs protection?	A1+A2: 220 bills / 4 days, ₪109–129 tickets, near-zero add-ons. Deepen staff discount to 40% when base price moves to ₪159 → their out-of-pocket stays identical (~₪95/dish).
What's the sequence?	Phase 1 (early Aug): premium dishes to ₪245–295 (82–87% Walk-In buyers) + activate approved ₪119 base + reprice 60%+ FC desserts. ≈ +10%. Phase 2 (Sep, if guardrails hold): base to ₪159 + staff discount 40% + keep set at ₪50. ≈ +12%, ~₪41.4K/day.
What do we watch?	Weekly, in the daily report's Customer Trend table: Staff bills (re-based floor after tagging settles), Walk-In bills (−8% = pause), set attachment (<30% = investigate), A2 share of staff bills (>50% = staff belt-tightening signal).
What if the goal is just "no loss"?	Then the target is not revenue — it is food cost 28% , which drops break-even to ₪35,973/day, below even today's revenue (₪36,867) . The shop becomes structurally loss-proof: pricing = rice base ₪129–139 (+~28%), premium held, brewed drinks ₪59–69, staff discount 30% (staff out-of-pocket unchanged). Expected ≈ ₪39.8K/day, FC 28.3%, profit ≈ +₪75K/month — see "TARGET-40K" in Section 7.

▲ **Honest caveats:** the post-tagging window is only 4 days (incl. Fri/Sat) — re-confirm shares after 2 clean weeks. Retention rates in scenarios are assumptions until Phase 1 measures them. AOT price compliance and Zoku (franchisor) approval required before any change. Royalty is 4% of the higher price — agree the discount treatment with Zoku.

7. P&L Scenarios — What COGS Does to the Decision

Base = week 12–18 Jul (฿258,072) · plate COGS ฿31.5 · non-rice FC 33% · royalty 4% · fixed ฿171,231/wk (rent 550K + payroll 192K monthly) · staff out-of-pocket frozen via 40% discount

SCENARIO (WALK-IN CHURN)	REV/DAY	FC%	PROFIT/MO — RICE ONLY	PROFIT/MO — ALL MENU
TODAY — current prices	36,867	31.2%	-17,812	-17,812
No loss	44,079–50,282	26.1 / 22.9%	+192,195	+372,818
A mild (budget solos -15%, set -5%, groups -3%)	41,927–47,645	26.4 / 23.1%	+143,389	+311,474
B moderate (-30 / -10 / -5%)	39,889–45,218	26.6 / 23.3%	+97,151	+254,944
C severe (-50 / -20 / -10%)	36,605–41,129	27.1 / 23.7%	+22,945	+159,916
D extreme (budget solos -100%, set -30%, groups -15%)	30,605–33,793	28.3 / 24.7%	-113,775	-10,942
TARGET-40K — the "no-loss" plan (rice ฿129–139, staff disc 30%, walk -5%)	39,803	28.3%	+75,426	—

► **The COGS effect is the hidden half of the case.** In scenario C, revenue is flat vs today (฿256K vs ฿258K) yet profit swings from -4.1K to **+5.3K/week** — 228 fewer plates cooked for the same money. Higher prices also lower the true break-even from ~฿38.9K to **~฿35.5K/day** (FC 31% → 27%), and per-plate contribution rises from ~฿85 to ~฿125–145, cutting the daily break-even from ~290 to ~200 plates. The **TARGET-40K** row is the safety-first calibration: sized so break-even (฿36.1K/day) sits *below today's actual revenue* — the shop cannot lose money even if the raise adds zero net revenue.

▲ The limit: fixed costs (฿171K/wk) don't shrink with volume. Profit crosses zero between C and D — roughly a 35% loss of rice-buying Walk-Ins. Raising the **whole menu** pushes even scenario D to break-even (-11K/mo), because the untouched segments (noodles, drinks, snacks — ฿55K/wk) get repriced too. If raising all menu: keep water ฿10 and the ฿50 set as fairness anchors.

Upside case — Walk-In shifts INTO the ₱50 set (set held at ₱50, staff frozen, rice +51%):

SCENARIO	BEHAVIOR ASSUMPTION	REV/ DAY	FC%	PROFIT/ MO
SET-1 mild shift	30% of solo non-set buyers convert, 10% churn, W1 -5% W4 -3%	42,852	26.5%	+161,179
SET-2 strong shift	50% convert, 15% churn, W1 fully retained	43,164	26.7%	+165,522
SET-3 full shift	70% convert, 10% churn, no W1/W4 loss	44,276	26.7%	+188,557

🔄 **The set is the churn antidote.** Every solo diner who converts instead of leaving swings the P&L twice: +₱46.7 revenue / +₱20.5 cost per set, and a retained ₱177 rice sale. Even the mild shift (SET-1) beats the equivalent churn-only case (A) by ~₱18K/month, and the gap between SET-1 and SET-3 — worth ~₱27K/month — is captured with menu-board bundle pricing and a one-line cashier script, at zero cost. Set economics per converted bill: ticket ₱165 → ₱254 (+54%).

8. Alternative Frame: Price to a 25% Blended Food Cost

Instead of "+X%", set prices to a target food cost. Why FC% is the real lever — every point of FC moves the daily break-even (fixed ₱24,462/day + 4% royalty):

BLENDED FC%	31.2% (TODAY)	30%	29%	28% ← NO-LOSS TARGET	27%	25%
Break-even ₱/day	37,749	37,063	36,510	35,973	35,452	34,453

► **The no-loss threshold is FC 28%.** At 28%, break-even (₱35,973/day) falls below today's revenue (₱36,867/day) — the shop stops being able to lose money at current volume. That needs only rice at ₱129–139 + brewed-drink repricing, with a 30% staff discount keeping staff out-of-pocket unchanged. FC 25% (packages below) is the profit-maximizing setting; FC 28% is the safety setting. Both use the same price card — the difference is how far down it you go.

PACKAGE	STRUCTURE	K037 PRICE	STAFF PAYS	REV/ DAY	FC%	PROFIT/ MO
P1 Uniform	All menu +25%, staff discount stays 10%	₱131	+25%	46,074	25.0%	+250,274
P2 Staff-frozen	All menu +35%, staff discount 33% → out-of-pocket unchanged	₱142	unchanged	46,074	25.0%	+250,274
P3 Targeted (recommended)	Each dish priced at cost ÷ 25% (see price card)	₱125	dial: 20–40% discount	~43–45K	25.5–26.5%	~+200–230K

P3 price card (price = cost ÷ 25% × 1.07, rounded):

MENU	COST	CURRENT	FC-25 PRICE	NEW FC%
K037 Krapao minced pork	29.19	105	125	25.0%
K038 Krapao chicken	27.02	105	119	24.3%
K039 / K046 garlic & oyster chicken	~25.5	110	109–115	~24.5%
K040 / K047 garlic & oyster pork	~32.7	110	139–145	~24.7%
K041 Scrambled-egg rice	25.61	95	109	25.1%
K008 Old-style fried rice	30.21	110	129	25.1%
K042 Wagyu krapao	42.47	195	keep 195	23.3%
K043 Thep pork / K013 Karaage	~38.4	160	165–169	~24.6%
K045 Roast duck krapao	32.17	115	139	24.8%
K014 Mama krapao / K018 clear soup	31.7	100–105	135–139	~24.8%
K015 / K019 Tom-yum mains	83–95	230–290	355–359	25–29%
Brewed drinks (lemon tea / Thai tea / olieng)	14–18	35–55	59–69	25–27%

► **Capped exceptions** (formula price would look absurd): fried moo-yor ฿69 (FC 32%), fried egg ฿25 (FC 30%), desserts ฿75 or delist, **water stays ฿10 and set stays ฿50 as price anchors**. Premium items below 25% offset them — blend lands ≈26%. P3 reads as "priced from cost", not "doubled" — easiest to defend to AOT/Zoku, lowest sticker shock, and the staff discount becomes the dial: start 20–25%, deepen to 30–40% if staff bills drop.
